DETAILED ACTION

Specification

1. The abstract of the disclosure is objected to because the abstract of the disclosure does not commence on a separate sheet in accordance with 37 CFR 1.52(b)(4). A new abstract of the disclosure is required and must be presented on a separate sheet, apart from any other text. Correction is required. See MPEP § 608.01(b).

Claim Rejections - 35 USC § 102

2. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless -

- (b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.
- 3. Claims 1, 12, 21-26 rejected under 35 U.S.C. 102 (b) as being anticipated by Reed et al (USP 6,023,386).

Regarding claims 1, 22-24, 26, Reed discloses a frequency and phase control apparatus, comprising:

a signal input section (20) for receiving a reproduction signal (col. 7, lines 45-55); an analog/digital conversion section (sampling device 24) for converting the reproduction signal (62) into a multiple bit digital signal based on a clock signal (col. 7, lines 50-67; col. 8, lines 1-5);

10/532,468

Art Unit: 2611

a maximum likelihood decoding section for converting the multiple bit digital signal into a binary signal (col. 8, lines 11-17);

a pattern detection section (discrete time sequence detector) for detecting a pattern (sequence) of the binary signal (col. 8, lines 11-15);

a determination section for determining whether or not the multiple bit digital signal and the clock signal are in synchronization with each other based on the detection result (col. 2, lines 47-58; col. 8, lines 17-22; col. 9, lines 25-35; col. 10, lines 1-5); and a clock generation section for adjusting at least one of a frequency and a phase of the clock signal based on the detection result and outputting the adjusted clock signal (col. 7, lines 34-45), wherein when the determination result of the determination section indicates that the multiple bit digital signal and the clock signal are in synchronization with each other, the maximum likelihood decoding section generates a binary signal based on a first state transition rule (col. 11, lines 5-10, 19-36); and when the determination result of the determination section indicates that the multiple bit digital signal and the clock signal are not in synchronization with each other, the maximum likelihood decoding section generates a binary signal based on a second state transition rule (col. 5, lines 6-31; col. 11, lines 28-50).

Regarding claim 12, Reed discloses wherein when the determination result of the determination section (intervals) indicates that the multiple bit digital signal and the clock signal are in synchronization with each other, the maximum likelihood decoding section generates a binary signal based on a first state transition rule (col. 11, lines 5-10, 19-36); and when the determination result (i.e., plurality of synchronization

Art Unit: 2611

sequence) of the determination section indicates that the multiple bit digital signal and the clock signal are not in synchronization with each other, the maximum likelihood decoding section generates a binary signal based on a second state transition rule (col. 5, lines 6-31; col. 11, lines 28-50).

Regarding claim 21, Reed discloses a maximum likelihood decoder for receiving a multiple bit digital signal generated based on a clock signal (col. 8, lines 11-17) and a flag (sync mark) indicating whether or not the multiple bit digital signal and the clock signal are in synchronization with each other, and converting the multiple bit digital signal into a binary signal based on the flag (col. 2, lines 47-58; col. 8, lines 17-22; col. 9, lines 25-35; col. 10, lines 1-5; col. 11, lines 51-65), wherein: when the flag indicates that the multiple bit digital signal and the clock signal are in synchronization with each other, the maximum likelihood decoder generates a binary signal based on a first state transition rule (col. 11, lines 5-10, 19-36), and when the flag indicates that the multiple bit digital signal and the clock signal are not in synchronization with each other, the maximum likelihood decoder generates a binary signal based on a second state transition rule (col. 5, lines 6-31; col. 11, lines 28-50).

Regarding claim 25, Reed discloses a method for reproducing information comprising:

a signal input section (20) for inputting a reproduction signal (col. 7, lines 45-55); an analog/digital conversion section (sampling device 24) for converting the reproduction signal (62) into a multiple bit digital signal based on a clock signal (col. 7, lines 50-67; col. 8, lines 1-5);

10/532,468

Art Unit: 2611

a maximum likelihood decoding section for converting the multiple bit digital signal into a binary signal (col. 8, lines 11-17);

a pattern detection section (discrete time sequence detector) for detecting a pattern (sequence) of the binary signal (col. 8, lines 11-15);

a determination section for determining whether or not the multiple bit digital signal and the clock signal are in synchronization with each other based on the detection result (col. 2, lines 47-58; col. 8, lines 17-22; col. 9, lines 25-35; col. 10, lines 1-5); a clock generation section for adjusting at least one of a frequency and a phase of the

clock signal based on the detection result and outputting the adjusted clock signal (col. 7, lines 34-45); and

a reproduction section (read/write functions) for reproducing information from the information recording medium based on the adjusted clock signal (col. 7, lines 18-38.

Allowable Subject Matter

- 4. Claim 13-20 allowed.
- 5. Claims 2-11 are objected to as being dependent upon a rejected base claim, but would be allowable if rewritten in independent form including all of the limitations of the base claim and any intervening claims.

Conclusion

6. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure.

Application/Control Number:

10/532,468

Art Unit: 2611

US Patents:

US Patent (6,003,153) to Shimoda.

US Patent (4,475,234) to Nishijima et al.

7. Any inquiry concerning this communication or earlier communications from the examiner should be directed to Qutbuddin Ghulamali whose telephone number is (571)-272-3014. The examiner can normally be reached on Monday-Friday, 7:00AM - 4:30PM.

Page 6

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Chieh M. Fan can be reached on (571) 272-3042. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see http://pair-direct.uspto.gov. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free). If you would like assistance from a USPTO Customer Service Representative or access to the automated information system, call 800-786-9199 (IN USA OR CANADA) or 571-272-1000.
